

We need zero emissions and to remove some of the carbon in the air

Ronald G. Trimmer

August 3, 2017

I am going to make Mark Godwin's day. James Hansen former NASA/GSFC director said that if all nations go to zero emissions it will not be enough. By the time we get to zero emissions there will already too much carbon in the air to halt global warming. We need to get to zero emissions and remove some of the carbon that is in the air. We can do that.

However, all countries must keep their word and meet their Paris goals. China is ahead of schedule in meeting its goals. China is not saying if the U.S. is not going to meet their goals then we aren't either. The consequence for noncompliance is an unstable climate for everyone including Mark Godwin.

I suggest Mr. Godwin check out libertarian Jerry Taylor. Taylor worked for the Cato Institute denying climate change. Taylor read the research and changed his mind.
