

Capitalist Reforms Are Boosting Prosperity in the Baltics

Daniel J. Mitchell

August 17, 2017

I'm a fan of the Baltic nations in part because they were among the first to <u>adopt flat tax</u> <u>systems</u> after the collapse of the Soviet empire. But tax reform was just the beginning. Estonia, Latvia, and Lithuania have liberalized across the board as part of their efforts to become prosperous.

<u>Economic Freedom of the World</u> is always the first place to check when you want to understand whether countries have good policy. And the <u>dataset for the Baltic nations</u> does show that all three nations are in the top quartile, with Lithuania and Estonia cracking the top 20.

So are these market-oriented policies paying dividends? Has the shift in the direction of <u>free</u> <u>markets and limited government</u> resulted in more prosperity?

The Short Answer: Yes

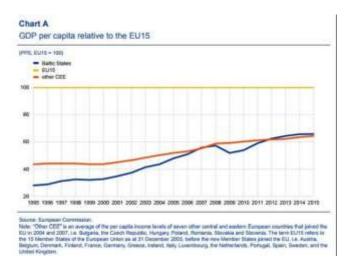

The European Central Bank has released <u>some very interesting analysis</u> on the economic performance of these countries.

The Baltic States have been able to maintain an impressive rate of convergence towards the average EU per capita income over the past 20 years. ...these three countries have each pursued a strongly free-market and pro-business economic agenda... The three countries are different in many ways, but share a number of key features: very high levels of trade and financial openness and very high labour mobility; high economic flexibility with wage bargaining mainly at firm level; relatively good institutional framework conditions; and low levels of public debt.

And this has translated into strong growth, which has resulted in higher incomes.

The Baltic States are among the few euro area countries (along with Slovakia) in which real GDP per capita in purchasing power standard (PPS) terms has shown substantial convergence towards the EU average over the last 20 years. While in 1995 their average per capita income (in PPS) stood at only around 28% of the EU15 average, in 2015 it reached 66.5% (see Chart A).

Here's the chart showing how quickly the Baltic countries are catching up to Western Europe.

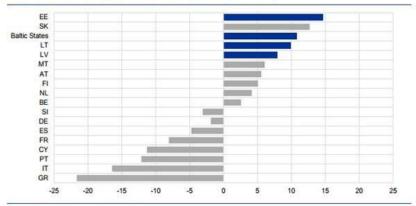

The ECB report also measured how fast the Baltic nations have grown compared to theory.

The long-term convergence performance of the Baltic States has exceeded what would have been expected based on their initial income level.

And here's the chart showing how they have over-performed.

Sources: Eurostat and ECB staff calculations.

Notes: Based on a cross-country linear equation on EU countries in which cumulative growth in GDP per capita as percentage of EU GDP per capita (in PPS) between 1999 and 2015 is regressed on initial GDP per capita as a percentage of EU GDP per capita (in PPS) in 1999. More formally: Δyi, 1999-2015=α +8 yi, 1999-ε (R2=0.62); where Δyi, 1999-2015 refers to the cumulative growth of GDP per capita between 1999 and 2015; yi, 1999 refers to initial per capita income level (in PPS), and ε is an error term. Ireland is left out of the sample as an outlier owing to the level shift in GDP that happened in 2015, largely as a result of the statistical impact of balance sheet restructuring by multinational enterprises. Luxembourg is also excluded, as GDP per capita computations are distorted by the large number of cross-border workers.

The ECB study says that the Baltic countries have been especially good about replacing cronyism with the <u>rule of law</u>.

One of the possible reasons for the fairly strong convergence performance of the Baltic States is the strong improvement in institutional quality in these countries... The Worldwide Governance Indicators of the World Bank, which is a composite indicator of institutional quality, suggests that institutional quality has improved markedly in the Baltic States – especially in Estonia – over the recent decades.

I agree. Indeed, <u>I've written</u> that Estonia is a good role model, having reduced corruption by limiting the power of politicians and bureaucrats.

The report also credits the three countries with rapid rebounds from the financial crisis, which is a point I made back in 2011.

While the crisis hit the Baltic States hard, the adjustment of imbalances was very fast. The rapid adjustment in fiscal balances and private sector balance sheets implied that the Baltic States could avoid the accumulation of a large debt overhang. In addition, the fast reduction in unemployment helped to decrease the risk of hysteresis, thus avoiding lasting consequences for potential growth. ...The external adjustment of the Baltic States was facilitated by painful but effective internal devaluation. ...This relatively fast adjustment in the Baltic States was facilitated in part by a strong initial rebound in employment growth, supported by an adjustment in labour costs.

I also think genuine spending cuts helped produce the quick economic rebound.

Full Convergence

Though the report does warn that there are not guarantees that the Baltic countries will fully converge with Western Europe.

International experience suggests that countries that reach a middle income level, like the Baltic States, tend to find it difficult to converge further and achieve a high income level. A World Bank study suggests that out of 101 middle-income economies in 1960, only 13 had become high-income economies by 2008.

This is a good point. As <u>I explained two years ago</u>, full convergence is very difficult. North America and Western Europe became rich in part because of <u>very small public sectors</u> in the 1800s and early 1900s. Indeed, there was <u>virtually no welfare state until the 1930s</u> and the level of redistribution was comparatively small until the 1960s.

Unfortunately, this is one area where the Baltic nations are weak. Yes, the burden of government spending may be modest compared to other EU countries, but the public sector nonetheless <u>consumes more than 35 percent of GDP</u>. And even though these nations have flat taxes, they also have stifling payroll taxes and government-fueling value-added taxes.

Another problem (not just in the Baltic region, but all through Eastern Europe) is that <u>the demographic outlook is unfriendly</u>, which means that the welfare state automatically will become a bigger burden over time.

If the Baltic countries want genuine convergence (or if they want to surpass Western Europe), that will require additional reform, particularly efforts to reduce the burden of government spending to the levels found in <u>Hong Kong</u> and <u>Singapore</u>.

Unfortunately, it's more likely that policy will move in the other direction. There are <u>constant</u> <u>efforts</u> to repeal the flat tax systems in the Baltic countries. And efforts by the European

Commission to harmonize business taxation ultimately may undermine the <u>pro-growth approach</u> to business taxation in the region as well.

P.S. For those who want an in-depth look at a Baltic nation, I recommend <u>this video</u> about Estonia. And if you want some amusement, check out how Paul Krugman <u>wanted people to believe</u> that Estonia's 2008 recession was caused by 2009 spending cuts.
